

## ABSTRACT OF THE DISCLOSURE

The invention concerns a method for making an article (1) comprising at least a sheet melamine (2, 2') foam piece with thickness sufficiently thin to exhibit flexibility and no flexural elasticity, which consists in: cutting by peeling a melamine foam block (40) into a strip with thickness sufficiently thin to exhibit flexibility and no flexural elasticity, and in making the article (1) using at least one sheet melamine foam piece derived from said strip. An article obtained by the inventive method can be used for many applications, in particular, in for surface cleaning, where it can advantageously be substituted for a standard double-faced sponge substantially identically. Such an article exhibits, when used as a towelette, flexibility and no flexural elasticity which makes it easy to use. Moreover, it is more hygienic than a double-faced sponge since it is disposable.
